Requests

This bulletin is one in a series of North Central and Southern Cooperative bulletins. It represents a contribution to Southern Regional Project S-176, "Interregional Marketing Systems for Grains and Soybeans." The Illinois Agricultural Experiment Station is the publishing station. Requests for copies of this bulletin may be sent to Office of Agricultural Communications and Education, 67 Mumford Hall, 1301 West Gregory Drive, University of Illinois, Urbana, Illinois 61801.

Abstract

In general, changes in the quantity of grain harvested between 1982 and 1983 were offset by changes in inventory. Relatively fixed demands in normally deficit states resulted in an increased volume of receipts and transportation by rail and truck. Percentage changes in volume shipped were less than percentage changes in production in most surplus states. Transportation requirements per bushel of grain produced increased with the reduced quantity harvested in 1983 because deficit states required additional supplies that were transported from more distant sources of supply.

Preface

This bulletin reports the results of research conducted by the Southern Regional Research Committee S-176, "Interregional Marketing Systems for Grains and Soybeans." This research, initiated by the S-176 Committee, involved collection of grain flow data in nine states represented by members of the Committee.

This bulletin is one of a series of regional bulletins resulting from the research. Grain flow data were collected for five grains (corn, soybeans, wheat, oats, and sorghum) for 1985 and for three grains (corn, soybeans, and wheat) for the years 1982 and 1983. Each bulletin in the series reports data for one grain. The data were summarized and the survey coordinated under the supervision of Joseph E. Vercimak in the Department of Agricultural Economics, University of Illinois at Urbana-Champaign.

The work in this bulletin was completed under the supervision of a Grain Flow Subcommittee of the S-176 Technical Committee. The members of that subcommittee were Lowell D. Hill and Joseph E. Vercimak, University of Illinois; T. Q. Hutchinson, U.S. Department of Agriculture; Jeffrey E. Jordan, University of Georgia; and Albert J. Allen, Mississippi State University. The success of this project, however, is also due to the cooperation of over 900 grain marketing firms and the efforts of researchers in all participating states.

The research was funded in part by the Federal Railroad Administration under contract No. DTFR 53-84-C-00036; the Agricultural Marketing Serivce, USDA; the Agricultural Cooperative Service, USDA; the Illinois Department of Agriculture; and the Soo Line Railroad. Administration of the grant funds was coordinated by Joseph E. Vercimak.

Acknowledgements

The authors wish to acknowledge the contributions of Joe Vercimak for his leadership in collecting and processing the 1982-83 grain flow information. The authors also wish to thank Debra Edinger for typing the numerous revisions of the draft of this and the other grain flow publications. We express special appreciation to the following Research Assistants: Karen Bender, Martin Patterson, Daniel Marriott, Shailendra Pradhan, Brian Anderson, and Jeffrey Austman, who spent many hours checking, reconciling, and correcting the thousands of data entries required for the final tables in this report. Albert Allen, Eric Wailes, and Stephen Ott served as the review committee, as the publications moved through the various revisions.

Impact of Production Changes on Soybean Movements

Among Selected States. 1982-1983

Purpose of the Study

Introduction

Although there is considerable information available regarding the production and use of soybeans in the United States, there is less information available concerning soybean movement and the importance of each transportation mode. Data on soybean movements by mode of transportation provide crucial input for the decisions made by private industry. Private firms need to know the history of grain flows in order to make sound decisions about investing or dis-investing in grain handling capacity.

Soybeans movement data are also important for government officials, who need to know current patterns of transportation to judge how changes in government policies and regulations could affect various regions of the country. While government policies to reduce total production in the United States have been in operation for many years, their effects on transportation requirements and direction of grain movements are difficult to assess because many other factors also enter into the determination of the marketing channel. Changes in government programs often result in relatively small changes in total production because, in many cases, changes in yield have offset changes in acreage. Changes in production can also be offset by changes in inventories held by government or private firms. As a result, it is difficult to match changes in origins, destinations, and modes of transport with any particular policy.

A drought in 1983 reduced soybean production to the lowest level since 1976. The dramatic change in production between 1982 and 1983 provided an opportunity to evaluate shifts in destinations and mode of transport as the industry adapted to the reduced volume.

Nine states were selected for the comparative analysis using a survey of grain handlers for calendar years 1982 and 1983. States participating in the survey were Alabama, Arkansas, Georgia, Illinois, Kentucky, Louisiana, Mississippi, Ohio, and Tennessee. Each of these states is a member of the Southern Regional Research Committee S-176, "Interregional Marketing Systems for Grains and Soybeans."

Objectives

The overall objective of this study was to analyze the transportation of soybeans from origins in selected states to destinations during 1982 and 1983. The specific objectives of this study were to ascertain:

- (1) the volume of soybeans moved between various origins and destinations during 1982 and 1983;
- (2) the market share of each transportation mode employed in moving this soybeans;
- (3) the effect of changes in soybean production and supply on shipment patterns.

Methodology

For sampling purposes, grain handling firms were categorized according to function. Categories included inland grain elevators, export elevators, river elevators, feed firms, corn processors, corn wet millers, corn dry millers, flour millers, and other firms. For descriptive purposes, elevators were further classified as country, terminal, or subterminal elevators. Feed firms were further classified as feed processors, feed mills, feedlots, or poultry operations.

The population of grain firms included all domestic facilities handling unprocessed grain after leaving the farm gate. The identification of a specific grain flow ended when the grain was processed, fed, or exported. For example, a feed processor was considered as a final destination for grain processed into feed and no attempt was made to identify grain movements after the grain was processed or exported.

Listings of firms by size (i.e., storage capacities, processing capacities, etc.) revealed a skewed distribution for various firm categories in most states. In these cases, a relatively small percentage of firms handled a relatively large proportion of the volume. Where the number of firms in a particular firm class was small, the sampling rate was 100 percent. Where the population contained a small group of high volume handlers or processors, the high volume group was sampled at a rate of 100 percent. Sampling rates for the remaining firms in a size category varied from 10 to 25 percent. Each state participant had the flexibility to increase sampling rates as conditions warranted.

Sample Expansion

Estimates of grain movements for each state as a whole were obtained by expanding each sample observation by an appropriate multiplier. A multiplier of 4.0, for example, was used to expand a sample of firms selected at a rate of 25 percent for a particular population strata. Likewise, a multiplier of 1.0 was used where firms in a particular size or geographic group were sampled at a rate of 100 percent.

Data Reconciliation Procedures

After survey data were compiled and tabulated, a procedure for cross-checking grain flows was devised in order to provide consistent estimates of state-to-state flows. Due to errors of sampling, estimation, or expansion, survey data from the shipping state did not always agree with the volume data estimated from the survey in the receiving state. In general, estimates obtained from the shipping state were more accurate since receivers (i.e., processors and exporters) often had less information regarding the origins of their grain. This was especially true where grain was purchased through a broker. For truck movements of grain, researchers reconciled the differences between the quantity shipped and

the quantity received by utilizing survey data from each state and researchers' knowledge about shipping patterns, price relationships, and production-utilization balances.

Secondary sources of information were available for rail and barge movements between states. Estimates of state-to-state grain movements by water were provided by the Army Corps of Engineers. Estimates of state-to-state grain movements by rail were provided by the carload waybill sample drawn by the Interstate Commerce Commission.

The procedure for reconciling barge and rail grain movements involved comparing shipments reported by the Corps of Engineers on inland waterways and waybill sample statistics for railroads, with data received from interviews. In some cases, secondary data provided additional support for survey estimates. In other cases, secondary data provided a useful compromise where survey figures varied widely.

Other important secondary data sources were the estimates of "exportable surpluses" produced in each state. Each state's representative provided information about production, consumption, inventory change, and the remaining surplus or deficit available to be exported or imported by the state. Because much of this information, especially about consumption, was based on estimates, the numbers were not expected to equal those obtained from the survey. The "production/utilization" estimates provided researchers with a comparison of the quantity of grain available to be exported from a state with survey estimates of outbound shipments. Estimates of production and utilization are available from Wailes and Vercimak (Wailes and Vercimak, 1988).

Comparisons among the various data sources increased the confidence in estimates obtained from sampling the population of grain handling firms. The logic and consistency of each flow summarized in this report have been checked by each state representative conducting the survey.

Soybean Production and Supply

During the 1982-83 period, soybean producers used about 20.4 percent of all cropland from which principal crops were harvested in the United States (66 million acres). The average value of the soybean crop at the farm level was 12.6 billion dollars, representing about 18 percent of the average value of all principal field crops (Wailes and Vercimak, 1989).

The volume of soybeans crushed by domestic processors averaged more than one billion bushels over the 1982-83 period

(Table 1). The volume of soybeans processed into oil and meal varied from year to year, depending upon the availability of soybeans and demands for meal, oil, and exports (Leath, Hill, and Fuller, 1981). Most of the soybean meal produced in the United States was either exported or used as a feed ingredient. Crude soybean oil was exported, used directly, or further processed for human consumption (Allen, et. al., 1980).

The volume of soybeans transported was large because the crop was grown in relatively concentrated production areas but processed in many locations. A large volume

Source: Fats and Oils Situation, Economics and Statistics Service, USDA, FOS-300, July, 1980 to July, 1987.

was also channeled to export primarily through Mississippi River and Gulf ports — New Orleans, Baton Rouge, Pascagoula, and Mobile (Leath, Hill, and Fuller, 1981).

Soybean production by region was concentrated in the Corn Belt (Ohio, Illinois, lowa, Indiana, and Missouri), the Delta (Mississippi, Arkansas, and Louisiana) and the Lake states (Michigan, Minnesota, and Wisconsin). The Corn Belt's share of soybean production was 52 percent in 1982 and 53.6 percent in 1983, while the Delta's share was 12.5 percent in 1982 and 12.1 percent in 1983 (Table 2). The Lake States accounted for 10 percent of the total U.S. soybean production in 1982 and 12.2 percent in 1983.

Soybean production by state was concentrated in Illinois, Iowa, Indiana, Missouri, Ohio, and Minnesota during the 1982-83 period. Combined, these six states accounted for 59.7 percent of total U.S. production in 1982 and 62.8 percent in 1983.

Changes in Production

The reduced production in 1983 due to adverse weather conditions and government supply control programs provided a contrast with 1982. Total U.S. production in 1982 was 2.190 billion bushels, but production dropped 25 percent in 1983 to only 1.636 billion. Although a draw-down of inventory helped offset the lower production, total supplies were reduced, and crush and exports declined dramatically (Table 1).

The decreased production was not uniformly spread throughout the soybean producing states. The decline was most dramatic in the Appalachian region, the Southeastern region, the Delta region, and the Southern plains (Table 2). The percentage change in production was less than the national average in the Northeast states, the Lake states, the Corn Belt, and the Northern plains. However, there were wide variations from state to state even within these regions. For example, Delaware and North Dakota both had signifi-

cant increases in production, while Missouri experienced a nearly 40 percent decline, Kentucky dropped by more than 50 percent, and all but one of the Appalachian states had nearly 50 percent decreases in production.

Within the nine-state region included in the study, Kentucky had the greatest percentage decrease (52.3 percent) followed closely by Tennessee (48.3 percent).

Alabama, Georgia, Arkansas, and Mississippi experienced drops in production of more than 33 percent. Production in Illinois and Ohio dropped by more than 20 percent between 1982 and 1983. Illinois and Ohio have usually been surplus states, producing supplies that require transshipment to states such as Alabama, Georgia, Kentucky, and Tennessee. The lack of supplies in these states during the 1982-83 period had an impact upon the shipment patterns.

Analysis of Shipments and Receipts

Intrastate Shipments

The volume of soybeans shipped among firms within the borders of the nine states increased from 208 million bushels in 1982 to 284 million bushels in 1983, despite the decrease in production (Tables 3 and 4). Truck accounted for a larger share in 1983 than in 1982, increasing from 82.3 percent to 85.3 percent. Truck transport volume doubled in Illinois in 1983. More short-distance transport to processors and river elevators was performed by truck, probably because the short supply in 1983 required additional assembly and transport to meet processing requirements.

Interstate Receipts

The volume of soybeans received by the nine states in the study increased 15.2 percent from almost 208 million bushels in 1982

to almost 239 million bushels in 1983 (Table 5). One of the main reasons for the increased volume of soybean receipts was the shortfall in production in 1983. Total production in the nine-state region declined 29 percent between 1982 and 1983, from 986 million bushels to 697 million bushels, requiring an increase in soybean receipts from outside the region.

As managers of soybean marketing facilities competed for soybeans to meet current and anticipated processing and export demands, more soybeans entered market channels from storage. The major processing requirements in Illinois and Ohio, and their access to ports through the Mississippi River system and Great Lakes, resulted in an increase in total receipts in those two states between 1982 and 1983 (Table 5).

Ohio and Illinois receipts were up by nearly 30 and 50 percent, respectively. Ohio, which in 1982 was nearly self-sufficient in supplying soybeans for its own consumption and had a large volume of Toledo exports, became a deficit state in 1983. This required Ohio to receive supplies from states with lower processing capacity and from states where production losses were less severe. In Illinois, additional supplies had to be brought in from outside the state to meet the relatively fixed demands of processing plants and inland and river subterminal elevators.

Arkansas also showed over a 46 percent increase in receipts from other states, although operating from a much smaller base than the midwestern region.

Receipts by Mode of Transport

Between 1982 and 1983, the mode of transport bringing in supplies from other states to the nine states shifted away from tuck and toward rail and barge (Table 5). In 1982, 57.9 percent (120.3 million bushels) of all interstate receipts in the nine-state area were moved by truck. In 1983, total truck receipts dropped to only 106.4 million bushels,

accounting for 44.5 percent of total receipts by all modes. Receipts by rail increased from 63.9 to 99.5 million bushels between 1982 and 1983. Barge receipts also increased from 23.5 to 33.4 million bushels. Barge gained approximately 2 percentage points in market share (Table 5).

In contrast, Louisiana receipts from other states dropped by 76 percent between 1982 and 1983. However, their production declined by only 10 percent — the smallest of any major producing state. Mississippi also experienced a large decline in receipts, relying on inventories to supply processing and shipment demands.

Overall, the volume of soybean receipts from out-of-state sources moved by barge and rail increased for the nine states between 1982 and 1983 (Table 5). In 1982, 11.3 and 30.8 percent of the soybean receipts were transported by barge and rail, respectively. In 1983, barge's share increased to about 13.9 percent and rail's to 41.6 percent. The increased importance of barge and rail was accompanied by a reduced share supplied by truck. Truck's share declined from 57.9 percent in 1982 to 44.5 percent in 1983.

The shifts among modes of transport between 1982 and 1983 were not uniform among states. For Alabama, the decrease in receipts from out-of-state sources was distributed among all three transport modes. Truck receipts decreased from 13.4 million bushels in 1982 to almost 11.1 million bushels in 1983. Rail and barge receipts decreased from 8.8 and 8.7 million bushels to 6.2 and 5.6 million bushels, respectively.

In contrast, Illinois' receipts from other states by barge and rail increased substantially, from 29.8 million bushels (rail) and 4.7 million bushels (barge) in 1982 to 56.8 million bushels (rail) and 5.9 million bushels (barge) in 1983. The volume of truck receipts also rose, from 27.2 million bushels in 1982 to 29.6 million bushels in 1983, an increase of 8.8 percent.

Note: Numbers in parentheses are state shares of the nine-state region receipts. They may not add to 100 due to rounding.

^a Does not include port area receipts.

Truck receipts for Georgia, Kentucky, and Louisiana decreased between 1982 and 1983 — from 6.7 to 5.7 million bushels for Georgia; from 10.4 to 8.9 million bushels for Kentucky; and from 1.6 to .2 million bushels for Louisiana. Rail receipts also declined for Georgia (from 6.2 to 5.9 million bushels) and Louisiana (from 1.7 to .5 million bushels). For Mississippi, the state with the largest decline in both truck and barge usage, soybean receipts by both barge and truck decreased by 93.2 percent.

Interstate Shipments

Interstate shipments included shipments by the nine states to all other states and port areas. Therefore, total shipments exceeded total receipts (Table 6). While total receipts for the nine states increased between 1982 and 1983, total shipments from these states declined from 561.5 million bushels in 1982 to 489.6 million bushels in 1983. There was a dramatic drop in shipments to ports. Much of the decline in shipments resulted from a loss of truck shipments from states to the ports located in Alabama and Louisiana.

Rail shipments also declined because of the decreased volume of shipments to ports. The volume shipped by barge remained virtually unchanged. This left barge with an increase in modal share, truck with a decrease, and rail with only a slight decline from 15.7 percent to 15.5 percent (Table 6).

All states in the study except Georgia and Mississippi decreased the volume of soybeans shipped in 1983. The largest loss was in Illinois and Ohio (about 18 million bushels each). Both states experienced production decreases of more than 20 percent, which were offset by increases in receipts. Kentucky reported the largest percentage decline in shipments because of a 52.3 percent drop in production. Kentucky receipts also declined, although by only 1.4 percent.

Port Receipts

Receipts at ports are incomplete because only the nine states in the survey provided information on shipments to ports. However, partial data about origins from non-participating states were gathered using secondary data and information provided by the ports within the survey area.

Inspections for export showed a significant drop in volume of soybeans exported between 1982 and 1983. The largest absolute decline occurred at the Gulf ports while the largest percentage decline was experienced by the Great Lakes. Only the Pacific ports increased in volume and market share (Table 7).

The volume of soybeans inspected for export from the Louisiana Gulf region was approximately the same in 1983 as in 1982. However, the decline in inspections in the Great Lakes and Atlantic regions helped to boost the Gulf's share of exports from 81.9 percent to 84.1 percent. Despite the slight increase in export share, the Gulf's total volume declined from almost 762 million bushels in 1982 to 700.2 million bushels in 1983 due to the production shortfall in 1983.

The Pacific was the only port region that showed an increase in the volume of soybeans purchased by foreign countries during 1982-83, from 25.9 million bushels in 1982 to 28.7 million bushels in 1983. Its share of total U.S. soybean exports increased by one-fourth, from 2.8 percent in 1982 to 3.4 percent in 1983.

Some important changes occurred between 1982 and 1983 as a result of decreased supplies in states that normally provided soybeans to port regions. The total volume of soybeans received at the port areas from the nine-state region decreased from 449.9 million bushels in 1982 to 389.7 million bushels in 1983 — a reduction of 13.4 percent (Table 8). While all port regions shared in the decreased volume, the largest drop was in the Texas Gulf region and the smallest was in the North Atlantic region.

Source: Grain and Feed Market News, Agricultural Marketing Service, USDA, Washington, D.C., various issues

The Louisiana Gulf received about 75 percent of the total shipments to ports by the nine states in 1982 and 80.6 percent in 1983. The South Atlantic export area ranked a distant second in both 1982 and 1983, with receipts in 1982 of 48.4 million bushels, and in 1983 of 32.5 million bushels.

Truck shipments decreased for all port regions except the Louisiana Gulf. Rail shipments increased for all port regions except the Atlantic ports. Barge volume to the Gulf declined by 10.6 percent (Table 8).

The port destinations varied among the nine states. Although the Gulf ports provided the primary outlet for all nine states, Illinois and Ohio originated the largest volume for the Gulf ports as well as supplying the Lake and Atlantic ports (Table 9).

Alabama's relative contribution to port receipts declined from 2.4 percent in 1982 to 1.86 percent in 1983 (Table 10). The state experienced a major drop in shipments, especially to Mobile. Arkansas shipments to

ports also decreased, from 42.8 million bushels in 1982 to 34.9 million bushels in 1983 (Table 10), primarily because of a reduction in barge shipments to the Louisiana Gulf ports (Table 9).

Georgia's shipments to ports remained virtually unchanged. Illinois had a slight decline, primarily as a result of a drop in barge movements to the Louisiana Gulf. Kentucky's share of the export market dropped from 3.1 percent to 2.5 percent (Table 10). The primary reason was a loss in volume of rail shipments from Kentucky to the Louisiana Gulf. Louisiana, Mississippi, and Tennessee all maintained nearly constant shares of shipments to port areas in 1982 and 1983, even though total volume declined. Mississippi was one of the few states to show an increase, with 37.4 million bushels shipped to ports in 1982 and 39.6 million bushels shipped in 1983. Ohio's shipments to port areas decreased by over 23 million bushels between 1982 and 1983, primarily because of

 $^{^{\}rm a}\,$ lncludes secondary data only; no truck data were provided by these states.

a reduction in rail shipments to the Atlantic coast (Table 10).

Barge carried 74.6 percent of the soybean shipments to export ports from the nine states in 1982 and 77 percent in 1983. Rail shipments accounted for 13.2 percent in 1982 and 13.5 percent in 1983, while truck accounted for 12.2 percent in 1982 and 9.5 percent in 1983 (Table 9).

When rail and barge data for non-participating states (truck data from these states were not available) were included with the survey data from the nine states, total receipts at ports declined between 1982 and 1983 by 12.23 percent: from 848.2 million bushels in 1982 to 744.5 million bushels in 1983 (Table 10). The percentage decrease for all states was only slightly less than for the nine-state region alone.

The states with the largest port shares in 1982 were Illinois, Iowa, Missouri, and Ohio. In 1983, Illinois had the largest share, Minnesota had the second largest, and Iowa, Missouri, and Ohio held the third, fourth, and fifth spots (Table 10). The largest absolute increase in shipments to ports was Minnesota's (an increase of 29 million bushels and 40.9 percent between 1982 and 1983). Minnesota experienced only a 10 percent drop in production (Table 2) and was therefore better able to supply ports than were Illinois and Iowa.

Foreign Destinations for U.S. Soybean Exports

In 1982, the Netherlands received 200.5 million bushels, or 21.6 percent of the total volume of soybeans exported, making that nation the most important destination for U.S. soybeans (Table 11). However, it should be noted that Rotterdam, Netherlands, is a transshipment port for the rest of the European Community. Japan ranked second in 1982 with 153 million bushels, or 16.5 percent of the volume of soybeans exported in that year.

These two countries' rankings were reversed in 1983, with Japan purchasing 167

million bushels and the Netherlands 160.8 million bushels. Spain ranked third both years, averaging 96.7 million bushels for the period. The Federal Republic of Germany (West) ranked fourth in 1982 with 66.9 percent, and Belgium ranked fifth with 49.1 percent. In 1983, the Republic of China (Taiwan), accounted for 47 million bushels of soybeans and replaced the Federal Republic of Germany (West) as the fourth leading purchaser of U.S. soybeans. Belgium remained in fifth place.

The Netherlands, Japan, and Spain were the major purchasers of soybeans from the Gulf Region during 1982-83. The average volume of soybeans bought by the Netherlands from Gulf ports accounted for about 24.3 percent of the total. Japan averaged about 18 percent and Spain about 9.8 percent.

State Origins and Destinations

Analysis of detailed data in the Appendix tables reveals interesting patterns of change in mode and destination. For example, as a result of a 33.4 percent reduction in production (Table 2), Arkansas' interstate shipments decreased from 60.6 million in 1982 to 47.2 million bushels in 1983 (Table 6). Appendix Tables A-2 and A-11 show that barge receipts by Arkansas increased almost four-fold primarily due to increased volume from Illinois origins. Likewise, Arkansas' intrastate truck shipments increased by over 200 percent (21.5 million bushels). These data indicate that Arkansas' increased demand for interstate supplies was filled by Illinois' surplus diverted from Gulf ports to Arkansas River terminals. These soybeans were then transported (mostly by truck) to processing plants that in 1983 had been served by local supplies or by rail from Kansas.

Overall, the modal share in the nine-state region changed very little. However, each of the Appendix tables reveals important shifts in origins, destinations, and the primary modes of transport. At state and substate lev-

els, these shifts had far-reaching consequences for transportation policies and rates. The impact of reduced production regardless of the cause (weather, government programs, or prices) had significant impacts on transportation demands and rates.

Supplemental Analysis of Non-Participating States

Although only nine states were included in the survey of grain handling firms, other data sources provided information on volumes shipped by rail and barge. These data sources were: for rail, the ICC Waybill Sample, 1982 and 1983, and for barge, source data from the U.S. Army Corps of Engineers, Waterborne Commerce of the United States, 1982 and 1983.

Without survey data, no adjustments to data from secondary sources were possible and no information on trade volumes was available. However, even the rail and barge data for the two years reveal useful relationships and changes over time. Therefore, these numbers have been included in Appendix B (1982 data) and Appendix C (1983 data) for all states. These tables include all adjustments for participating states presented in Appendix A as well as unadjusted data for non-participating states for 1982 and 1983.

Conclusion

The primary objective of this study was to analyze the effect of a major change in production of soybeans between 1982 and 1983 on shipment patterns in selected states. The combined production in the nine states decreased from 986 million bushels in 1982 to only 697 million bushels in 1983. The decreased production of soybeans in 1983 lowered total exports, shifted origin-destination patterns, increased transportation requirements for all modes combined, and decreased short-haul truck movements as compared to long-haul barge movements.

Production and supplies available for crushing declined in all of the nine states. Lower volumes of supplies in states that are usually net importers required increased shipments into these states. Surplus states found their surpluses reduced and the destinations of their surpluses shifted from export to domestic processors.

The total volume of soybeans received by the nine selected states from other states increased from almost 208 million bushels in 1982 to 239.2 million bushels in 1983, an increase of 15.2 percent. This increase in interstate receipts can be attributed to the large decrease in production in 1983 and the associated reduction of inventories to meet domestic and export demands.

This reduction of production in states with large processing capacities resulted in increased transportation volumes in 1983 as managers and owners competed to compensate for the shortfall in local production. The market share of rail and barge receipts from other states increased between 1982 and 1983. Rail's share of the soybean receipts from other states increased 35.2 percent, while barge's share increased 23.5 percent.

The volume of truck shipments decreased in almost all of the states surveyed with the exception of Mississippi. Rail shipments from Illinois, Kentucky, and Louisiana declined in 1983. Barge shipments in the nine states declined slightly with the largest change coming from Arkansas (a decrease of 8.7 million bushels).

The total volume of soybeans shipped to other states decreased from 562 million bushels in 1982 to 490 million bushels in 1983. Illinois ranked first in terms of the total volume of soybeans shipped, with about 178 million bushels in 1982 and 160.6 million bushels in 1983. The major market outlet for Illinois soybeans was the Louisiana Gulf, which accounted for about 79.9 percent of the total volume of soybeans shipped from Illinois to other states in 1982 and 81.7 percent in 1983. Between 1982 and 1983, Gulf and Pacific port regions increased their share of total exports; Lakes and Atlantic port regions lost shares. The largest absolute increase in export volume was at the Louisiana Gulf; the largest decreases were at the Texas Gulf and Toledo ports.
